

Glossary

Purpose: Align vocabulary for internal teams, prospects, and AI prompts.

Term	Definition
MCP (Model Context Protocol)	Standard interface many AI clients use to connect tools; Reflect exposes memory operations over MCP.
Ambient Mode	User preference (default On). On = silent retrieval + silent capture of durable facts. Off = Suggested Memories (approval-required).
Suggested Memories	Ambient Off path: candidates are staged for dashboard approve / edit / reject.
Visibility / allowed vendors	Per-memory scoping so each connected AI tool only sees what it is permitted to see.
Shared memory	Org or sub-team pool after an explicit share action. Ambient Phase 1 does not auto-share.
Supersession / version history	Newer truth replaces or updates prior content while history remains available for audit and context.
Session briefing	On-connect context that orients the model to the user's memory state and Ambient preference.
Deployment modes	Hosted, isolated-hosted, and self-host — differing ownership and network boundaries.
Audit trail	Record of reads, writes, auth, and admin actions (including Ambient captures) for compliance review.
Async diligence	Public markdown + prompts + PDFs that let prospects evaluate Reflect with their own AI before a live call.
NDA technical pack	Deeper architecture, questionnaires, and competitive materials shared only for active evaluations.
