

Use Cases Index

Each paragraph below links to the `/use-cases/*` pages plus the `/diligence` docs that support the same story.

Healthcare & Regulated Industries

Healthcare teams typically evaluate Reflect in a private or isolated deployment so clinical and operational context stay inside the approved boundary. Start with `/diligence/security-compliance` and `/diligence/deployment-architecture` , then the `/use-cases/healthcare` page for the buyer narrative.

Fintech & Banking

Fintech buyers care about auditability, residency, and controlled egress. Reflect's hosted / isolated / self-host options and MCP/REST access let the same organizational memory appear across approved tools. Pair `/use-cases/fintech` with the security and deployment docs — deeper competitive comps stay under NDA.

Legal & Compliance

Legal ops need persistent memory for playbooks, regulation notes, and matter context. Point evaluators to `/use-cases/legal` , `/diligence/glossary` (shared memory, audit trail), and the security doc for audit expectations.

AI-Native SaaS & Product Teams

These teams run multiple AI tools (Claude, ChatGPT, Cursor). Reflect keeps organizational context available across those tools instead of trapped in one vendor's memory. See `/use-cases/ai-native-saas` , `/diligence/positioning` , and `/diligence/technical-faq` .
